

EMS API Gateway — Simple Block Diagram

Current architecture and explicit Gateway routing

Gateway routing

/ems-dev/v1/api/auth/** → Auth Service :8083

/ems-dev/v1/api/employees/** → EMS Backend :8080

/ems-dev/v1/api/departments/** → EMS Backend :8080

Typical authenticated request

1. Client sends Bearer JWT to Gateway :8082.
2. Gateway matches the API path and forwards to the correct service.
3. EMS Backend :8080 validates JWT and authorizes the request.
4. Auth Service :8083 is used for registration/login and JWT generation.
